

Fume Extraction

We design fume extraction to suit your requirements, this is determined by the tank dimensions, the quantity of tanks to be extracted, the type of chemical and the operating temperature. We can supply the complete system including the side hoods, manifold, stack, fan and a scrubber if required.

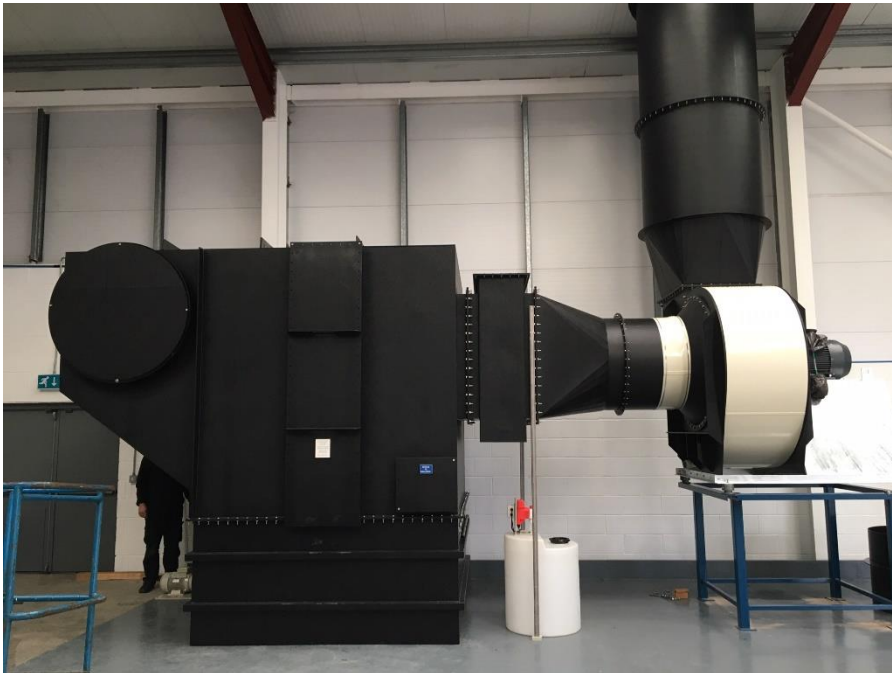

This line had extraction hoods at the rear, however they are sometimes situated along the side of the tanks. This is decided based on the tank dimensions. Manifolds are usually at high level, but can be lower if there are height restrictions.

This customer was limited for space so the process line was inside a shipping container. We placed the extraction on top of it to make use of the space.

All equipment is bespoke and will be designed around your process, therefore the size of the stack and scrubber differ in each photo. Below is a very large fan and scrubber system, with the stack existing the roof above.
